MAGEN DANIEL SYSTEMS LLP

ENGINEERING
INTO THE REAL WORLD

Embedded Systems / Connected Mobility / IoT / Edge AI

Hardware / Firmware / Cloud / Applications

COMPANY & PRODUCT PORTFOLIO | 2026

NON-CONFIDENTIAL / NORTH AMERICA BUSINESS DEVELOPMENT

Built around applied engineering

Technical execution from concept to pilot integration

WHO WE ARE

Magen Daniel Systems LLP is a Bengaluru-based engineering company working across electronics, embedded firmware, connected systems, cloud software and application development. Projects can begin with a focused module, prototype, integration task or a broader connected-product program.

HOW WE ENGAGE

Requirements / Architecture / Prototyping / Validation / Integration

One stack. Multiple entry points.

Embedded Electronics

System architecture, components, electronics integration and PCB bring-up.

Firmware & Connectivity

Device logic, diagnostics, BLE, Wi-Fi, cellular, GNSS and OTA planning.

IoT & Remote Monitoring

Telemetry, sensor integration, device-cloud workflows and monitoring dashboards.

Edge AI & Compute

Task-specific edge hardware, camera and sensor processing, local inference.

Software & Backend

Web applications, APIs, databases, cloud integration and event workflows.

Mobile & UI/UX

Companion applications, operations interfaces, dashboards and prototypes.

Hands-on electronics development

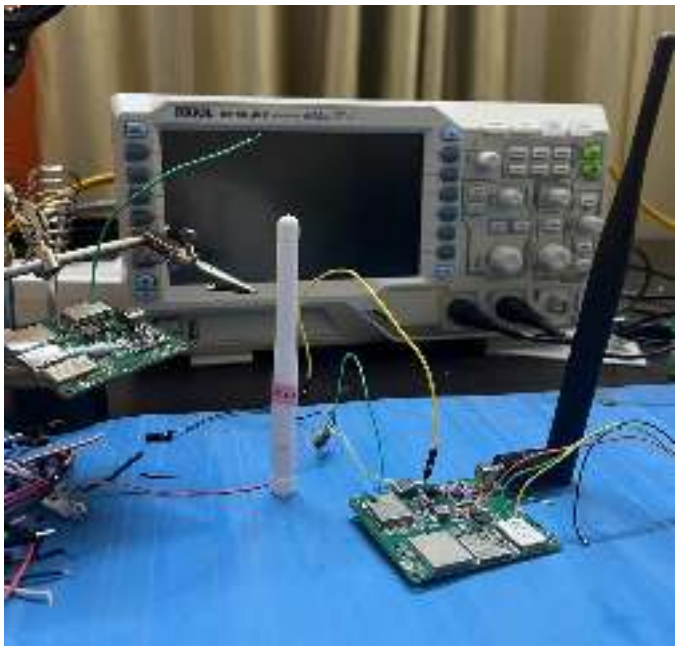

Actual MDS workbench and prototype photographs

R&D BENCH / ASSEMBLY & PROTOTYPING

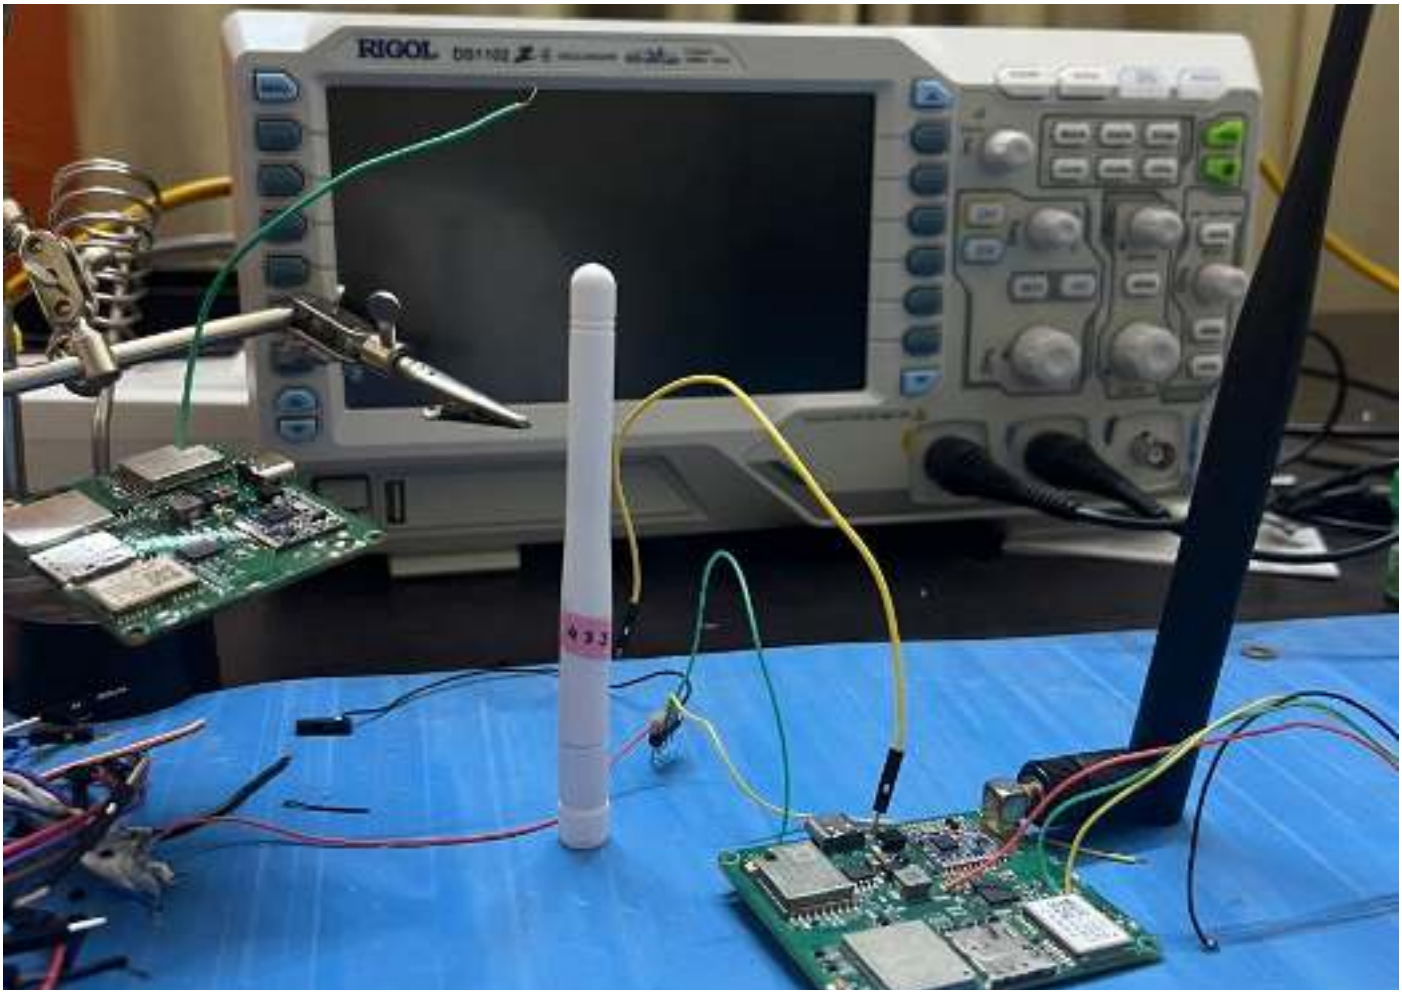

PCB CLEANING & BRING-UP

RF / ELECTRONICS TEST SETUP

Electronics, firmware & validation

TYPICAL WORK PACKAGES

PCB Design & Review

Schematics, component selection, board integration and prototype debug.

Firmware Bring-up

Interfaces, peripherals, communications and controlled software tests.

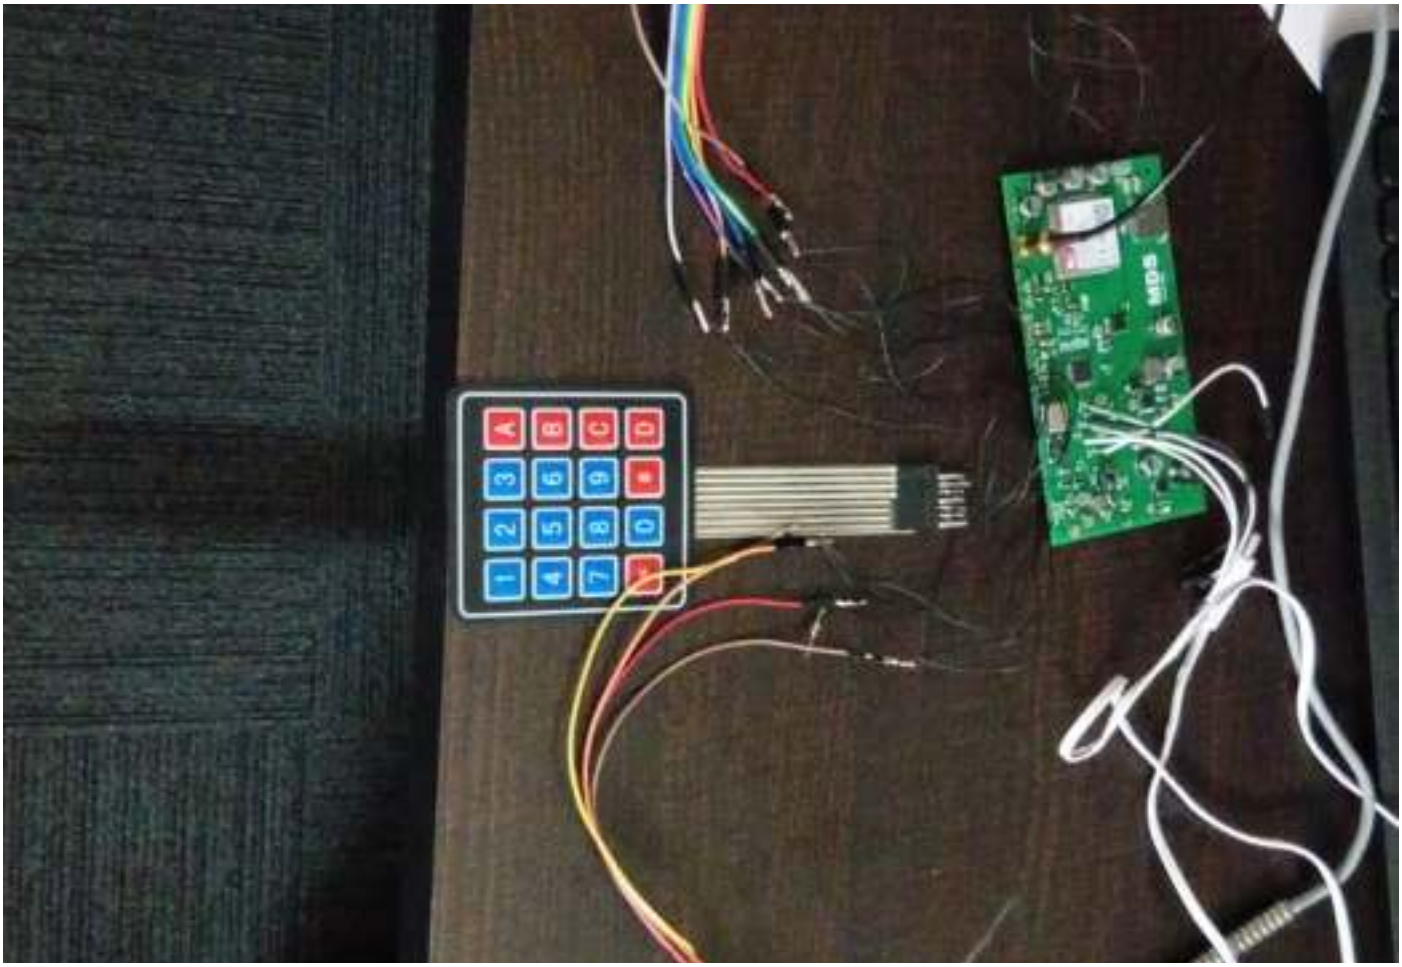

Testing & Troubleshooting

Bench measurement, diagnostic evidence and iterative problem isolation.

System Integration

Electronic hardware connected to applications, APIs and cloud services.

IoT from device to dashboard

SENSE

Sensor and device inputs

CONNECT

Wireless or cellular telemetry

PROCESS

Firmware and edge-side logic

MONITOR

Cloud, APIs and dashboards

ACT

Alerts and operational workflows

Application examples: remote asset monitoring, industrial field telemetry, connected devices, location-aware products and custom integration programs.

GLM | Fleet & Location Management

Example of a connected-device product direction

ILLUSTRATIVE PACKAGING CONCEPT / WHITE LABEL / OEM / ODM

APPLICATION

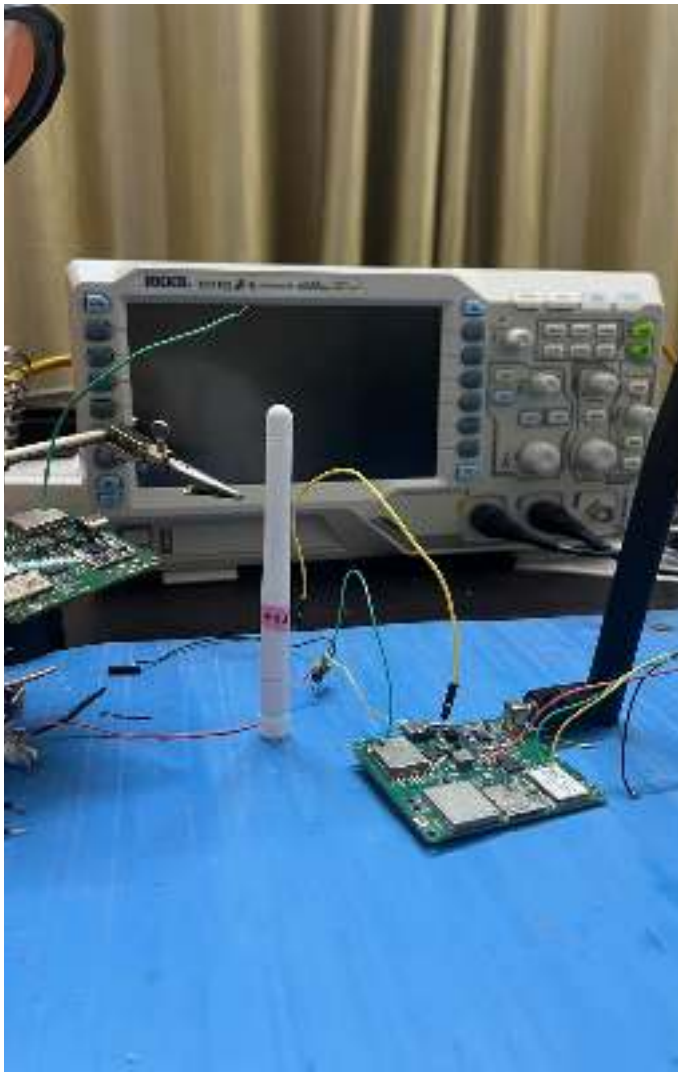

GLM is positioned for fleet and location management, with planned tracking, routes, geofencing, app-based monitoring, alerts and adaptable backend/server integration.

The image above illustrates a potential retail/OEM packaging format. It does not establish production availability, final specifications or an approved commercial offer.

GLIR | Group Connectivity & Safety

Remote-area operations and connected vehicle workflows

TECHNOLOGY DIRECTION

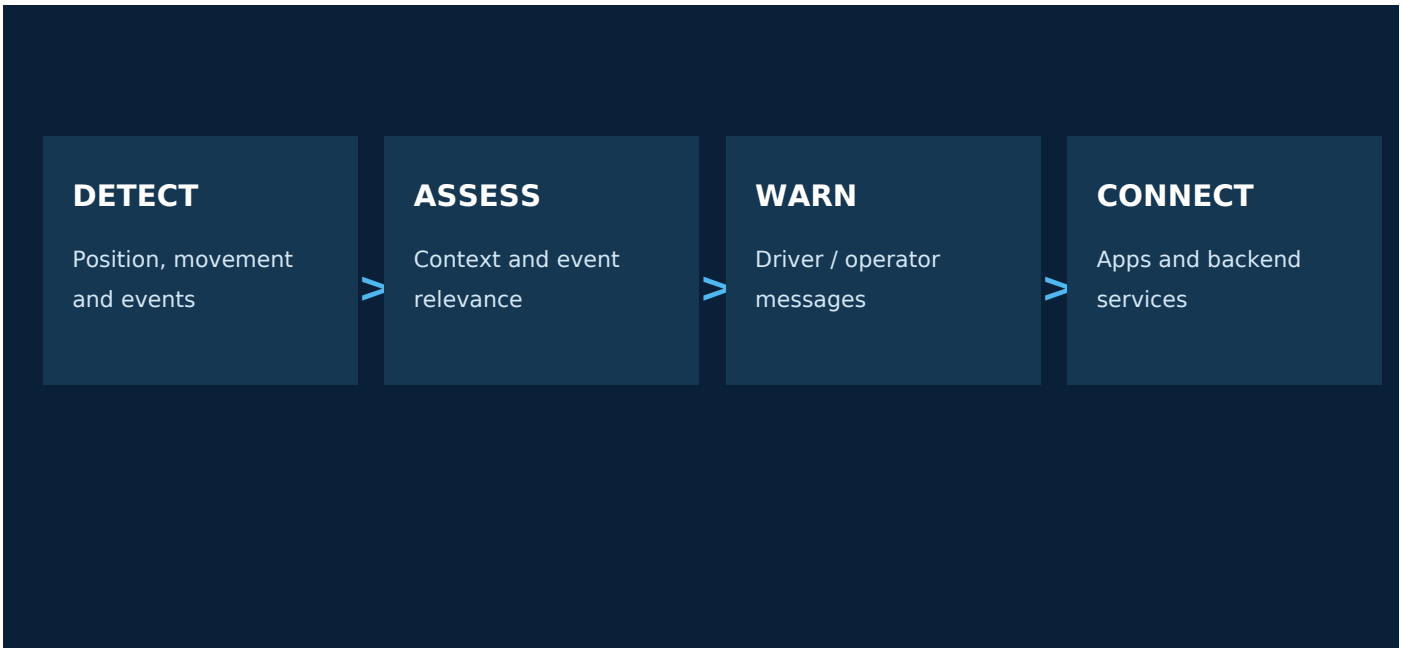

Configurable group connectivity, vehicle-safety workflows, location awareness and communication options involving BLE, Wi-Fi, cellular and LoRa, depending on variant and validation stage.

PROTOTYPE / DEVELOPMENT STATUS

Implementation, range and regional RF compliance require project-specific verification.

DWS & V2X safety architecture

Research and development directions

DRIVER WARNING SYSTEM

DWS is a driver-warning technology concept spanning location-aware hazards, transient road conditions and context-sensitive alerts. A public U.S. patent reference exists; personal patent ownership is separate from the company.

V2X PLATFORM DIRECTION

MDS V2X VERA represents a wider device, connectivity, app and backend direction, with future cooperative safety, offline relay and intelligence capabilities subject to engineering validation.

PUBLIC PATENT REFERENCE

US 11,731,645 B2 | Driver Warning System | Granted 22 August 2023

Hybrid relay & difficult-terrain IoT

FIELD DEVICE

Data collection

LOCAL LINK

Short or long-range radio

RELAY / GATEWAY

Coverage planning

BACKHAUL

Available network path

OPERATIONS

Alerts and insight

ENGINEERING MODEL

Coverage planning is site-specific. MDS evaluates terrain, distance, network availability, reliability and operating cost before recommending a pilot architecture. Range, frequencies, transmit power and deployment approvals are subject to local regulations.

Applications around the physical produc

Backend & API

Event ingestion, service interfaces, database integration and workflows.

Cloud & Operations

AWS-oriented application services, telemetry processing and infrastructure integration.

Mobile Applications

Android/iOS companion interfaces, notifications, configuration and monitoring.

Web Dashboards

Device views, operational reporting, maps, fleet management and admin tools.

Controlled path from scope to pilot

01 / REQUIREMENTS

Define use case, constraints, interfaces and success criteria.

02 / ARCHITECTURE

Select functional blocks, technology options and review gates.

03 / PROTOTYPE

Develop electronics, firmware, software or a focused proof of concept.

04 / VALIDATION

Perform bench and field-oriented verification with documented findings.

05 / INTEGRATION

Connect to the customer environment and define next deployment steps.

Flexible engineering collaboration

PROJECT ENGINEERING

Defined deliverables, milestones and technical scope.

SUBCONTRACT R&D

Specialist support for embedded, IoT, software or connected-product teams.

PROOF OF CONCEPT

Focused feasibility tests and prototype-led technical learning.

PILOT & INTEGRATION

Controlled pilots, review gates and customer-system integration.
